Summary of Antimicrobial Efficacy - Etiology¹

Pathogenic Microorganism	Description
<i>Pseudomonas aeruginosa</i>	Gram negative bacteria identified as a major cause of hospital acquired (nosocomial) infections. Causes wound infections (especially burn), meningitis, pneumonia and eye infections. Required for Hospital Disinfectants.
<i>Staphylococcus aureus</i>	Gram positive bacteria identified as a major cause of hospital acquired (nosocomial) infections. Colonizes food and secretes enterotoxins which cause food poisoning after ingestion. Causes wound infections, septicemia, endocarditis, meningitis, osteomyelitis and pneumonia. Required for Hospital Disinfectants.
<i>Aspergillus niger</i>	Black mold, found in shower and dressing rooms. Environmental contaminant may also cause "Aspergillosis."
<i>Enterobacter aerogenes</i>	Gram negative bacteria spread by anal/oral route of infection. Associated with bacteremia, respiratory, wound and urinary tract infections.
<i>Escherichia coli</i>	Gram negative bacteria spread by anal/oral route of infection, resulting in diarrhea outbreaks. Associated with urinary tract infections and bacteremia.
<i>Listeria monocytogenes</i>	Gram positive (rod shape) bacteria. Considered a potent food pathogen. Found in raw meat and poultry. Infections can result in meningitis or sepsis.
<i>Klebsiella pneumoniae</i>	Gram negative bacteria associated with severe pneumonia, bacteremia and urinary tract infections.
<i>Salmonella enterica</i>	Gram negative (rod shape) bacteria associated with acute gastroenteritis and diarrhea.
<i>Salmonella schottmuelleri</i>	Gram negative (rod shape) bacteria associated with acute gastroenteritis and diarrhea.
<i>Salmonella typhi</i>	Gram negative (rod shape) bacteria associated with acute gastroenteritis and diarrhea, the causative agent for typhoid fever.
<i>Shigella dysenteriae</i>	Gram negative bacteria directly spread by anal/oral route of infection; indirectly (including food, hands, flies) spread by contaminated food and inanimate objects resulting in bacillary dysentery.
<i>Enterococcus faecalis</i>	Gram positive (Enterococci) bacteria causing hemolysis, urinary tract infections and endocarditis.
<i>Trichophyton mentagrophytes</i>	Athlete's foot fungus. Found in shower and dressing rooms. Also the causative agent of Ring Worm, a fungi that is transmitted through non-socomal contact (e.g. activity mats, wrestling mats, etc)
Canine Distemper	Lipophilic (enveloped) RNA virus. Highly contagious among dogs causes fever, gastrointestinal and respiratory symptoms.
Feline Leukemia Virus	Non-enveloped RNA virus. One of the causative agents of lymphosarcoma in cats.
Herpes Simplex Type 1	Lipophilic (enveloped) DNA virus may result in oral mucocutaneous lesions. Associated with most orofacial herpes and HSV encephalitis.

Influenza A/Japan	Lipophilic (enveloped) RNA virus. Causative agent in viral flu. Causes flu epidemics in nearly 2 of every 3 years.
Hepatitis B virus (HBV)	Lipophilic (enveloped) DNA virus of the hepadnavirus family. Causitive agent of Hepatitis B (serum hepatitis),
Hepatitis C virus (HCV)	Major cause of acute hepatitis and chronic liver disease, including cirrhosis and liver cancer. It is an enveloped RNA virus in the flavivirdae family.

Human Corona Virus	Single stranded RNA containing virus causing respiratory infection in humans. From order Nidovirales and Family Coronaviridae.
